IT SECURITY SYSTEMS

IT Audit, Quality Control, and Expert Opinions

Thank you for your interest,

Our services are sought after both during the initiation of new projects and the optimization of existing ones. This applies to specific tasks as well as regular reviews, ensuring compliance with security regulations and standards such as ISO/IEC 27001:2022.

We conduct security assessments for servers/companies, including:

1. Identification of vulnerabilities in server protection (uncovering security gaps)
2. Identification of weaknesses in network protection
3. Identification of potential threats related to human error/data handling by personnel, etc.
4. Additionally, we perform independent assessments and quality control of third-party services or products in the areas of server administration/monitoring, communication services, data storage and processing, as well as program and data interface security.

In the event of security breaches or incidents, we offer:

1. Identification and detection of unusual processes in the system
2. Identification and detection of modifications in the system (rootkits/scripts/keyloggers, etc., enabling monitoring, data theft, and complete system control)
3. Analysis of log files and other traces left by attackers
4. Evaluation of the extent of data leaks
5. Assessment of the possibility of data recovery
6. Assessment of the possibility of regaining control over the server

Expert Opinions:

1. Issuance of an official document confirming attacks, hacks, or poorly executed services.

Bimeg - IT Security Systems
Main Office
01023 Sportyvna Square 1A,
Kyiv, Ukraine
